

September 8, 2016

Dear Customer:

Western Extrusions Corporation located in Carrollton, Texas, is a manufacturer of aluminum extruded profiles. These profiles are designed to meet customer specifications and are produced in a wide variety of custom and semi-custom finishes including, mill finish, painted, and anodized. Shapes may also be produced with or without thermal barriers.

The raw material used by Western to produce its product is procured from large, well-established producers of aluminum both foreign and domestic. Western recycles 100% of its internal scrap for reprocessing into aluminum billet and log which in turn Western repurchases for its raw material use. Scrap content, which includes both post consumer scrap and post industrial content, can vary depending upon local market availability of each of these scrap sources at the aluminum producer.

On average, Western's raw material producers average 45% post industrial scrap, and 20% post-consumer scrap content.

Sincerely,

A handwritten signature in blue ink that reads "Michael Tierney".
